SpaceX Falcon 9 first stage Landing Prediction

Lab 1: Collecting the data

Estimated time needed: **45** minutes

In this capstone, we will predict if the Falcon 9 first stage will land successfully. SpaceX advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because SpaceX can reuse the first stage. Therefore if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against SpaceX for a rocket launch. In this lab, you will collect and make sure the data is in the correct format from an API. The following is an example of a successful and launch.

Several examples of an unsuccessful landing are shown here:

Most unsuccessful landings are planned. Space X performs a controlled landing in the oceans.

Objectives

In this lab, you will make a get request to the SpaceX API. You will also do some basic data wrangling and formating.

- Request to the SpaceX API
- Clean the requested data

Import Libraries and Define Auxiliary Functions

We will import the following libraries into the lab

In [1]:
```
# Requests allows us to make HTTP requests which we will use to get data from an AP
import requests
# Pandas is a software library written for the Python programming language for data
import pandas as pd
# NumPy is a library for the Python programming language, adding support for large,
import numpy as np
# Datetime is a library that allows us to represent dates
import datetime

# Setting this option will print all collumns of a dataframe
pd.set_option('display.max_columns', None)
# Setting this option will print all of the data in a feature
pd.set_option('display.max_colwidth', None)
```

Below we will define a series of helper functions that will help us use the API to extract information using identification numbers in the launch data.

From the `rocket` column we would like to learn the booster name.

In [2]:
```
# Takes the dataset and uses the rocket column to call the API and append the data
def getBoosterVersion(data):
    for x in data['rocket']:
       if x:
```

```
        response = requests.get("https://api.spacexdata.com/v4/rockets/"+str(x)).js
        BoosterVersion.append(response['name'])
```

From the `launchpad` we would like to know the name of the launch site being used, the logitude, and the latitude.

In [21]:
```
# Takes the dataset and uses the launchpad column to call the API and append the da
def getLaunchSite(data):
    for x in data['launchpad']:
       if x:
         response = requests.get("https://api.spacexdata.com/v4/launchpads/"+str(x)
         Longitude.append(response['longitude'])
         Latitude.append(response['latitude'])
         LaunchSite.append(response['name'])
```

From the `payload` we would like to learn the mass of the payload and the orbit that it is going to.

In [3]:
```
# Takes the dataset and uses the payloads column to call the API and append the dat
def getPayloadData(data):
    for load in data['payloads']:
       if load:
        response = requests.get("https://api.spacexdata.com/v4/payloads/"+load).jso
        PayloadMass.append(response['mass_kg'])
        Orbit.append(response['orbit'])
```

From `cores` we would like to learn the outcome of the landing, the type of the landing, number of flights with that core, whether gridfins were used, wheter the core is reused, wheter legs were used, the landing pad used, the block of the core which is a number used to seperate version of cores, the number of times this specific core has been reused, and the serial of the core.

In [4]:
```
# Takes the dataset and uses the cores column to call the API and append the data t
def getCoreData(data):
    for core in data['cores']:
            if core['core'] != None:
                response = requests.get("https://api.spacexdata.com/v4/cores/"+core
                Block.append(response['block'])
                ReusedCount.append(response['reuse_count'])
                Serial.append(response['serial'])
            else:
                Block.append(None)
                ReusedCount.append(None)
                Serial.append(None)
            Outcome.append(str(core['landing_success'])+' '+str(core['landing_type'
            Flights.append(core['flight'])
            GridFins.append(core['gridfins'])
            Reused.append(core['reused'])
            Legs.append(core['legs'])
            LandingPad.append(core['landpad'])
```

Now let's start requesting rocket launch data from SpaceX API with the following URL:

In [5]:
```
spacex_url="https://api.spacexdata.com/v4/launches/past"
```

In [6]:
```
response = requests.get(spacex_url)
```

Check the content of the response

In [7]:
```
print(response.content)
```

nch will deliver essential supplies to the International Space Station using the r
eusable Dragon 1 cargo spacecraft. The external payload for this mission is Intern
ational Docking Adapter 3, replacing IDA-1 lost in SpaceX\'s CRS-7 launch failure.
This mission will launch from SLC-40 at Cape Canaveral AFS on a Falcon 9, and the
 first-stage booster is expected to land back at CCAFS LZ-1.","crew":[],"ships":

The target system consists of Didymos, 780 meters in diameter, and its moonlet Dimorphos, 160 meters. The DART spacecraft will intercept the double asteroid, using autonomous guidance to crash into the smaller one. Moving at about 6 km/s, the transferred momentum should alter Dimorphos\'s 12 hour orbital period around its companion by several minutes. The mission tests several technologies, including the Small-body Maneuvering Autonomous Real-Time Navigation (SMART Nav) used to differentiate and steer toward the target body and Roll-Out Solar Arrays (ROSA) with Transformational Solar Array concentrators. NASA\xe2\x80\x99s Evolutionary Xenon Thruster \xe2\x80\x94 Commercial (NEXT\xe2\x80\x93C) ion engine will also be demonstrated, although the spacecraft\'s primary propulsion is hydrazine thrusters. DART should arrive at Didymos in late September 2022, when it is about 11 million kilometers from Earth. Ten days before impact, the Italian Space Agency\'s cubesat LICIACube will be deployed to observe the collision and ejecta with its two cameras. Earth-based telescopes will be used to measure the altered orbit.","crew":[],"ships":["5ea6ed30080df4000697c913","5ea6ed2f080df4000697c90b","5ea6ed30080df4000697c912"],"capsules":[],"payloads":["5fe3c4a6b3467846b3242192"],"launchpad":"5e9e4502f509092b78566f87","flight_number":138,"name":"DART","date_utc":"2021-11-24T06:20:00.000Z","date_unix":1637734800,"date_local":"2021-11-23T22:20:00-08:00","date_precision":"hour","upcoming":false,"cores":[{"core":"5f57c54a0622a633027900a1","flight":2,"gridfins":true,"legs":true,"reused":true,"landing_attempt":true,"landing_success":true,"landing_type":"ASDS","landpad":"5e9e3032383ecb6bb234e7ca"}],"auto_update":true,"tbd":false,"launch_library_id":"c4b2f90e-3385-4cbe-a89f-fc5f57da1bfb","id":"5fe3b107b3467846b324216b"},{"fairings":{"reused":null,"recovery_attempt":true,"recovered":null,"ships":["618fad7e563d69573ed8caa9"]},"links":{"patch":{"small":"https://images2.imgbox.com/fc/e7/esvHlHwA_o.png","large":"https://images2.imgbox.com/91/15/2LRaHihk_o.png"},"reddit":{"campaign":"https://www.reddit.com/r/spacex/comments/jhu37i/starlink_general_discussion_and_deployment_thread/","launch":"https://www.reddit.com/r/spacex/comments/r79osa/spacex_starlink_43_launch_discussion_and_updates/","media":null,"recovery":"https://www.reddit.com/r/spacex/comments/k2ts1q/rspacex_fleet_updates_discussion_thread/"},"flickr":{"small":[],"original":["https://live.staticflickr.com/65535/51732172914_4efa7d5210_o.jpg","https://live.staticflickr.com/65535/51730706247_4b5bf2899f_o.jpg","https://live.staticflickr.com/65535/51732172879_4ce91546ed_o.jpg"]},"presskit":null,"webcast":"https://youtu.be/594TbXriaAk","youtube_id":"594TbXriaAk","article":null,"wikipedia":"https://en.wikipedia.org/wiki/Starlink"},"static_fire_date_utc":null,"static_fire_date_unix":null,"net":false,"window":null,"rocket":"5e9d0d95eda69973a809d1ec","success":true,"failures":[],"details":null,"crew":[],"ships":["5ea6ed2d080df4000697c904","618fad7e563d69573ed8caa9","5ee68c683c228f36bd5809b5"],"capsules":[],"payloads":["6161d0f26db1a92bfba85355"],"launchpad":"5e9e4501f509094ba4566f84","flight_number":139,"name":"Starlink 4-3 (v1.5)","date_utc":"2021-12-01T23:20:00.000Z","date_unix":1638400800,"date_local":"2021-12-01T18:20:00-05:00","date_precision":"hour","upcoming":false,"cores":[{"core":"5ef670f10059c33cee4a826c","flight":9,"gridfins":tru

s":"The T\xc3\xbcrksat 5B communication satellite, which its construction work con
tinues at Airbus Defense and Space\'s facilities in Toulouse, France, will soon be
sent to the Cape Canaveral Space Launch Station located in Florida, United States.
The satellite will be launched into space onboard the Falcon 9 rocket following pr
e-launch preparations. With an estimated in-orbit lifetime of 30 years and the aim
of securing Turkey\xe2\x80\x99s orbital and frequency rights, T\xc3\xbcrksat 5B wi
ll be launched into an orbital slot at 42 degrees East. With 12 kW power, T\xc3\xb
crksat 5B will provide TV broadcasting and data communication services over a wide
coverage area that reaches the entire Middle East, the Persian Gulf, the Red Sea,
 the Mediterranean, North Africa, East Africa, South Africa and Nigeria. Apart fro
m that, the satellite will also provide customized services for airlines and comme
rcial ship operators around the world thanks to the fact that it operates in Ka-Ba
nd.","crew":[],"ships":["618fad7e563d69573ed8caa9","5ee68c683c228f36bd5809b5"],"ca

You should see the response contains massive information about SpaceX launches. Next, let's try to discover some more relevant information for this project.

Task 1: Request and parse the SpaceX launch data using the GET request

To make the requested JSON results more consistent, we will use the following static response object for this project:

In [8]:
```
static_json_url='https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud
```

We should see that the request was successfull with the 200 status response code

In [9]:
```
response.status_code
```

Out[9]:
```
200
```

Now we decode the response content as a Json using `.json()` and turn it into a Pandas dataframe using `.json_normalize()`

In [10]:
```
# Use json_normalize meethod to convert the json result into a dataframe
response=requests.get(static_json_url).json()
data=pd.json_normalize(response)
```

Using the dataframe `data` print the first 5 rows

In [12]:
```
# Get the head of the dataframe
data.head(1)
```

Out[12]:

	static_fire_date_utc	static_fire_date_unix	tbd	net	window	rocket	succ
0	2006-03-17T00:00:00.000Z	1.142554e+09	False	False	0.0	5e9d0d95eda69955f709d1eb	Fa

You will notice that a lot of the data are IDs. For example the rocket column has no information about the rocket just an identification number.

We will now use the API again to get information about the launches using the IDs given for each launch. Specifically we will be using columns `rocket`, `payloads`, `launchpad`, and `cores`.

In [13]:
```
# Lets take a subset of our dataframe keeping only the features we want and the fli
data = data[['rocket', 'payloads', 'launchpad', 'cores', 'flight_number', 'date_utc

# We will remove rows with multiple cores because those are falcon rockets with 2 e
data = data[data['cores'].map(len)==1]
data = data[data['payloads'].map(len)==1]

# Since payloads and cores are lists of size 1 we will also extract the single valu
data['cores'] = data['cores'].map(lambda x : x[0])
data['payloads'] = data['payloads'].map(lambda x : x[0])

# We also want to convert the date_utc to a datetime datatype and then extracting t
data['date'] = pd.to_datetime(data['date_utc']).dt.date

# Using the date we will restrict the dates of the launches
data = data[data['date'] <= datetime.date(2020, 11, 13)]
```

- From the `rocket` we would like to learn the booster name

- From the `payload` we would like to learn the mass of the payload and the orbit that it is going to
- From the `launchpad` we would like to know the name of the launch site being used, the longitude, and the latitude.
- From `cores` we would like to learn the outcome of the landing, the type of the landing, number of flights with that core, whether gridfins were used, whether the core is reused, whether legs were used, the landing pad used, the block of the core which is a number used to seperate version of cores, the number of times this specific core has been reused, and the serial of the core.

The data from these requests will be stored in lists and will be used to create a new dataframe.

In [14]:
```
#Global variables
BoosterVersion = []
PayloadMass = []
Orbit = []
LaunchSite = []
Outcome = []
Flights = []
GridFins = []
Reused = []
Legs = []
LandingPad = []
Block = []
ReusedCount = []
Serial = []
Longitude = []
Latitude = []
```

These functions will apply the outputs globally to the above variables. Let's take a looks at `BoosterVersion` variable. Before we apply `getBoosterVersion` the list is empty:

In [15]:
```
BoosterVersion
```

Out[15]:
```
[]
```

Now, let's apply `getBoosterVersion` function method to get the booster version

In [16]:
```
# Call getBoosterVersion
getBoosterVersion(data)
```

the list has now been update

In [17]:
```
BoosterVersion[0:5]
```

Out[17]:
```
['Falcon 1', 'Falcon 1', 'Falcon 1', 'Falcon 1', 'Falcon 9']
```

we can apply the rest of the functions here:

In [22]:
```
# Call getLaunchSite
getLaunchSite(data)
```

In [19]:
```
# Call getPayloadData
getPayloadData(data)
```

In [20]:
```
# Call getCoreData
getCoreData(data)
```

Finally lets construct our dataset using the data we have obtained. We we combine the columns into a dictionary.

In [23]:
```
launch_dict = {'FlightNumber': list(data['flight_number']),
'Date': list(data['date']),
'BoosterVersion':BoosterVersion,
'PayloadMass':PayloadMass,
'Orbit':Orbit,
'LaunchSite':LaunchSite,
'Outcome':Outcome,
'Flights':Flights,
'GridFins':GridFins,
'Reused':Reused,
'Legs':Legs,
'LandingPad':LandingPad,
'Block':Block,
'ReusedCount':ReusedCount,
'Serial':Serial,
'Longitude': Longitude,
'Latitude': Latitude}
```

Then, we need to create a Pandas data frame from the dictionary launch_dict.

In [25]:
```
# Create a data from launch_dict
data=pd.DataFrame(launch_dict)
data.head()
```

Out[25]:

	FlightNumber	Date	BoosterVersion	PayloadMass	Orbit	LaunchSite	Outcome	Flights	Grid
0	1	2006-03-24	Falcon 1	20.0	LEO	Kwajalein Atoll	None None	1	
1	2	2007-03-21	Falcon 1	NaN	LEO	Kwajalein Atoll	None None	1	
2	4	2008-09-28	Falcon 1	165.0	LEO	Kwajalein Atoll	None None	1	
3	5	2009-07-13	Falcon 1	200.0	LEO	Kwajalein Atoll	None None	1	
4	6	2010-06-04	Falcon 9	NaN	LEO	CCSFS SLC 40	None None	1	

Show the summary of the dataframe

In [26]:
```
# Show the head of the dataframe
data.head()
```

Out[26]:

	FlightNumber	Date	BoosterVersion	PayloadMass	Orbit	LaunchSite	Outcome	Flights	Grid
0	1	2006-03-24	Falcon 1	20.0	LEO	Kwajalein Atoll	None None	1	
1	2	2007-03-21	Falcon 1	NaN	LEO	Kwajalein Atoll	None None	1	
2	4	2008-09-28	Falcon 1	165.0	LEO	Kwajalein Atoll	None None	1	
3	5	2009-07-13	Falcon 1	200.0	LEO	Kwajalein Atoll	None None	1	
4	6	2010-06-04	Falcon 9	NaN	LEO	CCSFS SLC 40	None None	1	

Task 2: Filter the dataframe to only include `Falcon 9` launches

Finally we will remove the Falcon 1 launches keeping only the Falcon 9 launches. Filter the data dataframe using the `BoosterVersion` column to only keep the Falcon 9 launches. Save the filtered data to a new dataframe called `data_falcon9`.

In [41]:
```
# Hint data['BoosterVersion']!='Falcon 1'
data_falcon9=data[data.BoosterVersion=="Falcon 9"]
```

Out[41]:

	FlightNumber	Date	BoosterVersion	PayloadMass	Orbit	LaunchSite	Outcome	Flights	Grid
4	6	2010-06-04	Falcon 9	NaN	LEO	CCSFS SLC 40	None None	1	

Now that we have removed some values we should reset the FlgihtNumber column

In [42]:
```
data_falcon9.loc[:,'FlightNumber'] = list(range(1, data_falcon9.shape[0]+1))
data_falcon9
```

```
/home/jupyterlab/conda/envs/python/lib/python3.7/site-packages/pandas/core/indexin
g.py:1773: SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame.
Try using .loc[row_indexer,col_indexer] = value instead

See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stabl
e/user_guide/indexing.html#returning-a-view-versus-a-copy
  self._setitem_single_column(ilocs[0], value, pi)
```

Out[42]:

	FlightNumber	Date	BoosterVersion	PayloadMass	Orbit	LaunchSite	Outcome	Flights	Gri
4	1	2010-06-04	Falcon 9	NaN	LEO	CCSFS SLC 40	None None	1	
5	2	2012-05-22	Falcon 9	525.0	LEO	CCSFS SLC 40	None None	1	
6	3	2013-03-01	Falcon 9	677.0	ISS	CCSFS SLC 40	None None	1	
7	4	2013-09-29	Falcon 9	500.0	PO	VAFB SLC 4E	False Ocean	1	
8	5	2013-12-03	Falcon 9	3170.0	GTO	CCSFS SLC 40	None None	1	
...	...	...	...	...	...	...	...	...	
89	86	2020-09-03	Falcon 9	15600.0	VLEO	KSC LC 39A	True ASDS	2	
90	87	2020-10-06	Falcon 9	15600.0	VLEO	KSC LC 39A	True ASDS	3	
91	88	2020-10-18	Falcon 9	15600.0	VLEO	KSC LC 39A	True ASDS	6	
92	89	2020-10-24	Falcon 9	15600.0	VLEO	CCSFS SLC 40	True ASDS	3	
93	90	2020-11-05	Falcon 9	3681.0	MEO	CCSFS SLC 40	True ASDS	1	

90 rows × 17 columns

Data Wrangling

We can see below that some of the rows are missing values in our dataset.

In [43]:
```
data_falcon9.isnull().sum()
```

Out[43]:
```
FlightNumber       0
Date               0
BoosterVersion     0
PayloadMass        5
Orbit              0
LaunchSite         0
Outcome            0
Flights            0
GridFins           0
Reused             0
Legs               0
LandingPad        26
Block              0
ReusedCount        0
Serial             0
Longitude          0
Latitude           0
dtype: int64
```

In [ ]:

Before we can continue we must deal with these missing values. The `LandingPad` column will retain None values to represent when landing pads were not used.

Task 3: Dealing with Missing Values

Calculate below the mean for the `PayloadMass` using the `.mean()`. Then use the mean and the `.replace()` function to replace `np.nan` values in the data with the mean you calculated.

In [61]:
```
# Calculate the mean value of PayloadMass column
mean=data_falcon9["PayloadMass"].mean()

# Replace the np.nan values with its mean value
data_falcon9["PayloadMass"].replace(np.nan, mean,inplace=True)
data_falcon9.head()
```

Out[61]:

	FlightNumber	Date	BoosterVersion	PayloadMass	Orbit	LaunchSite	Outcome	Flights	Grid
4	1	2010-06-04	Falcon 9	6123.547647	LEO	CCSFS SLC 40	None None	1	
5	2	2012-05-22	Falcon 9	525.000000	LEO	CCSFS SLC 40	None None	1	
6	3	2013-03-01	Falcon 9	677.000000	ISS	CCSFS SLC 40	None None	1	
7	4	2013-09-29	Falcon 9	500.000000	PO	VAFB SLC 4E	False Ocean	1	
8	5	2013-12-03	Falcon 9	3170.000000	GTO	CCSFS SLC 40	None None	1	

In [62]:
```
data_falcon9.isnull().sum()
```

Out[62]:
```
FlightNumber       0
Date               0
BoosterVersion     0
PayloadMass        0
Orbit              0
LaunchSite         0
Outcome            0
Flights            0
GridFins           0
Reused             0
Legs               0
LandingPad        26
Block              0
ReusedCount        0
Serial             0
Longitude          0
Latitude           0
dtype: int64
```

In [64]:
```
data_falcon9.to_csv('dataset_part_1.csv', index=False)
```

You should see the number of missing values of the `PayLoadMass` change to zero.

Now we should have no missing values in our dataset except for in `LandingPad`.

We can now export it to a **CSV** for the next section,but to make the answers consistent, in the next lab we will provide data in a pre-selected date range.

```
data_falcon9.to_csv('dataset_part_1.csv', index=False)
```
